Aim: Design a dynamic web page with validation using JavaScript

- Added javascript validation to the login and registration form of the project.

Code:

```
<script type="text/javascript" src="js/custom-script.js"></script>
  <script type="text/javascript">
  $("#formValidate").validate({
    rules: {
      username: {
        required: true,
        minlength: 5
      },
      name: {
        required: true,
        minlength: 5
      },
                password: {
                        required: true,
                        minlength: 5
                },
      phone: {
                        required: true,
                        minlength: 4
                },
```

```javascript
    },
    messages: {
        username: {
            required: "Enter username",
            minlength: "Minimum 5 characters are required."
        },
        name: {
            required: "Enter name",
            minlength: "Minimum 5 characters are required."
        },
                    password: {
                            required: "Enter password",
                            minlength: "Minimum 5 characters are required."
                    },
        phone:{
                            required: "Specify contact number.",
                            minlength: "Minimum 4 characters are required."
                    },
    },
    errorElement : 'div',
    errorPlacement: function(error, element) {
      var placement = $(element).data('error');
      if (placement) {
        $(placement).append(error)
      } else {
        error.insertAfter(element);
      }
```

```
    }
  });
</script>
```
